

ABSTRACT OF THE DISCLOSURE

The present invention is aiming at a service setting system, a service setting method and a relay apparatus which does not require implementation of a communication protocol to inquire whether a service between a relay apparatus and service control apparatus should be provided, and which cut down a delay until service provision.

A relay apparatus 3, that received a service request signaling packet transmitted from communication terminal 1, transmits this service request signaling packet to a service control apparatus 6 in case this service request signaling packet is not transmitted from a service control apparatus 6 which controls own setting and a service control apparatus 6, that received a service request signaling packet, controls setting of each relay apparatus.
